During the movement of the points:

Initially, before the points start moving:

Reflection points:

- 1) Figuring out how to make the points disappear exactly before the chart ends was difficult, which led to causing the points overlap on the y axis and move further.
- 2) In order to be able to get the x axis to move, I tried the approach of slicing the json file and adding values one by one. However, this led to formation of multiple charts one by one in order, and did not give me the desired result.

- 3) Additionally, I spent a lot of time figuring out how to align the data points with the x axis. Getting the timing right to append and delete the values of the x axis was also something that I found difficult to do.
- 4) Iterating over the JSON file and making intervals to display on the screen at one point in time was also an approach that I tried to do, which gave me errors since it caused unequal intervals which made the process even harder.
